

ABSTRACT

The invention pertains to a method and system that uses similar functionalities of different components within a software application when executing the application and application components. In one embodiment, predefined structures are created for a component type, where each component type has a similar functionality when executed. Parameter information is received at a client and linked with the predefined to provide a script specific predefined structure. The component is executed by executing the script specific predefined structure. After a user exits the component, the script specific predefined structure is automatically deleted.
